

## Report for course assignment in project planning

This week was the first week back after a long and lovely holiday. When I first sat down and read the assignment I felt regret that I have not looked at some old assignment during the holiday, because although that this was not that difficult of an assignment I just felt that I had forgotten a lot. And I did not like that. But I was very good to be back. And I am full of hope that everything will get better as we go along. I have so much ideas in my head, but sometimes it can be hard to do it in real life, the way I want it.

At first when I sat down and read the assignment we were given, I was a bit glad it was this kind of an assignment, because this kind of planning is something I need more help with. Excel is such a big thing with a lot of more things you can do than you first know.

When I started to work on this I first had to google and think a lot about how long it would take and what kind of people you need to get a website all done. It is not something I think about a lot. Then I started writing down different tasks that I think would be a part of the process of making a website. The things I came up with first was things like: initial meeting- to start the communication about what the project was about, research, coding, get a photographer- so the firm can use its own pictures instead of using sites like for example getty images, people who can help with laws and the legal part of it. If they were to sell their product in an online store they would need to think about what kind of payment types they would use- like Klarna, payex, paypal or billing. With the backend of it the CRM-system could be used. ECM-system, like google drive or dropbox for files with info about the supplier, deals etc.

To communicate I think they would have used either teams, Slack or Dropbox. These platforms are great with both easy communicating and sharing photos and files. It is easy to use and understand.

As a Front-end developer the things we make/design/develop belongs to us all the way until the customer has bought it. To protect our work we need to copyright everything, that give us rights to use, adjust and develop.

Since I still have a bit of problems with excel I am not proud of what I did on this assignment, but I am trying and learning the best I can. Sometimes I feel like I have learned it, but then something happens and I feel lost again. I will definitely try to spend more of my free time to learn more about excel. Now I am excited about the next weeks assignment and what we are going to learn and deal with next time.
